

Datasets in R

The dataset I am using is this one below. I chose this dataset because I plan on using it for my final project so I might as well get a head start on it!

<https://www.kaggle.com/datasets/abdullahashfaqvirk/student-mental-health-survey>

R code

Load Dataset

```
library(readr)
mental_health <- read_csv("data/MentalHealthSurvey.csv")
```

Rows: 87 Columns: 21

-- Column specification -----

Delimiter: ","

chr (11): gender, university, degree_level, degree_major, academic_year, cgp...

dbl (10): age, study_satisfaction, academic_workload, academic_pressure, fin...

i Use `spec()` to retrieve the full column specification for this data.

i Specify the column types or set `show\_col\_types = FALSE` to quiet this message.

```
spec(mental_health)
```

```
cols(
  gender = col_character(),
  age = col_double(),
  university = col_character(),
  degree_level = col_character(),
  degree_major = col_character(),
  academic_year = col_character(),
  cgpa = col_character(),
  residential_status = col_character(),
  campus_discrimination = col_character(),
  sports_engagement = col_character(),
  average_sleep = col_character(),
  study_satisfaction = col_double(),
  academic_workload = col_double(),
  academic_pressure = col_double(),
```

```

financial_concerns = col_double(),
social_relationships = col_double(),
depression = col_double(),
anxiety = col_double(),
isolation = col_double(),
future_insecurity = col_double(),
stress_relief_activities = col_character()
)

```

```
print(mental_health)
```

```
